

Preliminary results of the SICM study about the use of Carboxy-methyl-cellulose and Poly-ethylene-oxide (Dynavisc®) in tenolysis in zone II of flexor tendon of the hand

G. Caruso, C. Novelli

Tendon adhesions

Adhesions reducing tendon gliding are one of the most common problem following flexor tendon repair reducing final AROM (Active Range of Motion) and preventing good results in terms of fast recovery

Tenolysis is OFTEN a valuable choice to improve tendon primary surgery results

Appropriate rehabilitation reduces but cannot prevent the formation of adhesion or their recurrence following tenolysis

Dynavisc: Adhesion barrier gel

DYNAVISC is a clear, absorbable gel acts as a temporary, protective barrier to effectively **separate tissues** and **reduce fibrosis** after various surgical procedures, without interfering with normal healing.

DYNAVISC is composed of (Carboxymethylcellulose (CMC), Poly-Ethylene Oxide (PEO), NaCl and CaCl based gel)

- Visco-elastic, "cohesive" properties
- Used not only for the prevention of fibrosis, but also for the reduction of inflammatory post-surgical syndrome.
- It is reabsorbed gradually, with hydrolytic natural process, followed by macrophage activity

Multicentre Clinical Trial on Efficacy of Dynavic in Tendon Adhesion Surgery

S.I.C.M. Società Italiana di Chirurgia della Mano

Rationale

- Study:
 - Multicentric (17 hand surgery services in Italy)
 - Controlled
 - Randomized

- Method:
 - Tenolysis procedure using/ non-using Dynavisc+ immediate rehabilitative program

- Goal:
 - Evaluation of results in patient Dynavisc+ vs Dynavisc- (TAM-VAS)

Project

- INCLUSION CRITERIA

- Adhesion of flexor tendon in zone II, in long finger without injuries of other tissue (bone-nerve-soft tissue loss)
- Monodigital adhesion
- Adhesion subsequent to lesion of at least 3 months ago
- Both male and female and age included among 18-65
- Informed consensus on surgical treatment

Project

- EXCLUSION CRITERIA

- Adhesion in flexor tendon zone I, III, IV and V
- Thumb adhesions
- Uncontrolled diabete mellitus, collagenopaties, Auto immunological conditions, Neoplasia, ematopoietic disorders, psicolagical diseases
- Pregnancy

Informed consensus

CONSENSO INFORMATO

Io sottoscritto/a dichiaro di essere stato/a informato/a in modo a me comprensibile dal Dott.

- Di essere affetto/a da rigidità secondaria a lesione tendinea

Sulla necessità di essere sottoposto/a all'intervento chirurgico di tenolisi flessori con possibile uso di gel antidierezionale (Dynavisc- materiale bio-compatibile")

- Sulle eventuali alternative di terapia e sulle conseguenze di un mancato trattamento della mia malattia
- Sulle caratteristiche dell'intervento proposto, sui benefici attesi, sulle conseguenze previste ed anche sui rischi e complicanze che devono comunque essere considerati in relazione all'intervento previsto, in modo particolare, tra le altre, sulla possibilità della risoluzione non completa della rigidità

Confermo pertanto di aver recepito consapevolmente quanto sopra e di aver potuto esprimere domande ed aver ottenuto i relativi chiarimenti.

*Per questi motivi, ACCONSENTO al trattamento proposto.
Circa il trattamento dei dati riguardanti la mia salute, AUTORIZZO i Medici della U.O. ad informare il Medico Curante Dott.*

Sede e data,

Clinical trial

- Anesthesia: Brachial plexus
- Tenolysis: standardized surgical technique
- Phisio-kinesitherapy: immediate rehabilitation – within 48 hours – performed by dedicated hand physiotherapist
- Evaluation:
 - TAM
 - VAS

Procedure

Rehabilitation Protocol

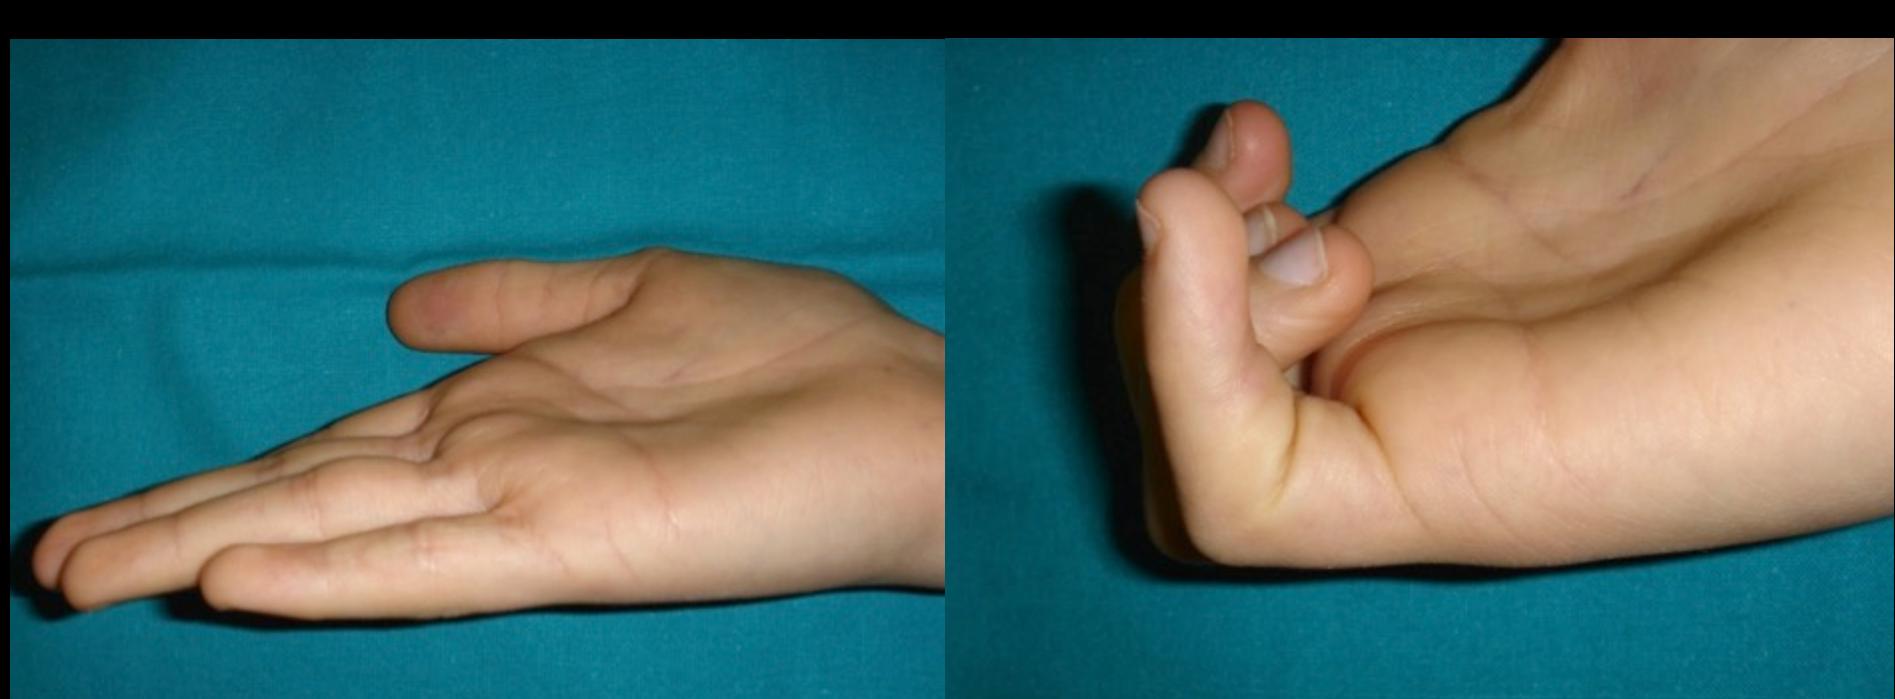

- Rehabilitation protocol starts immediately after surgery (if possible the same afternoon!!)
- From 1° dpo to 15°: once a day seance with the therapist + 5/6 session of exercises at home + 1-2 awake in the night + dynamic splints day and night
- From 15° dpo to 30°: once a day seance with the therapist + 5/6 session of exercises at home + dynamic splints day and night
- From 30°dpo to 60°: twice or trice a week seance with the therapist + 4/5 session of exercises at home+ dynamic splints day and night
- Dynamic splints until 90° dpo (even later when needed)

Rehabilitation Protocol

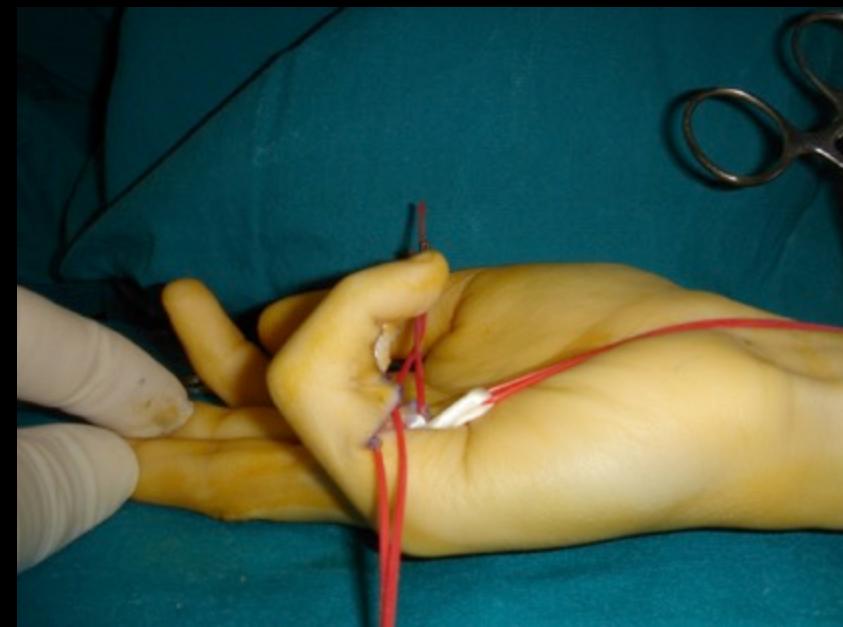

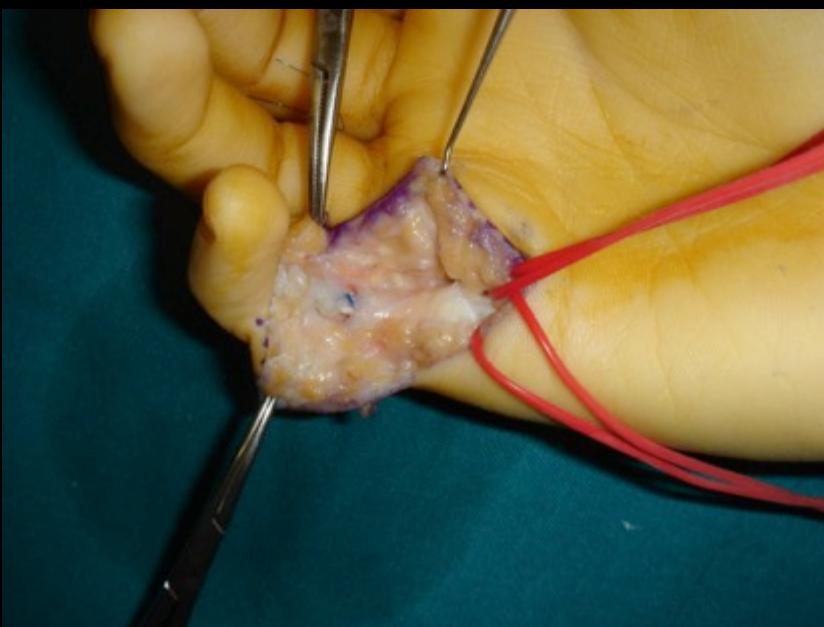

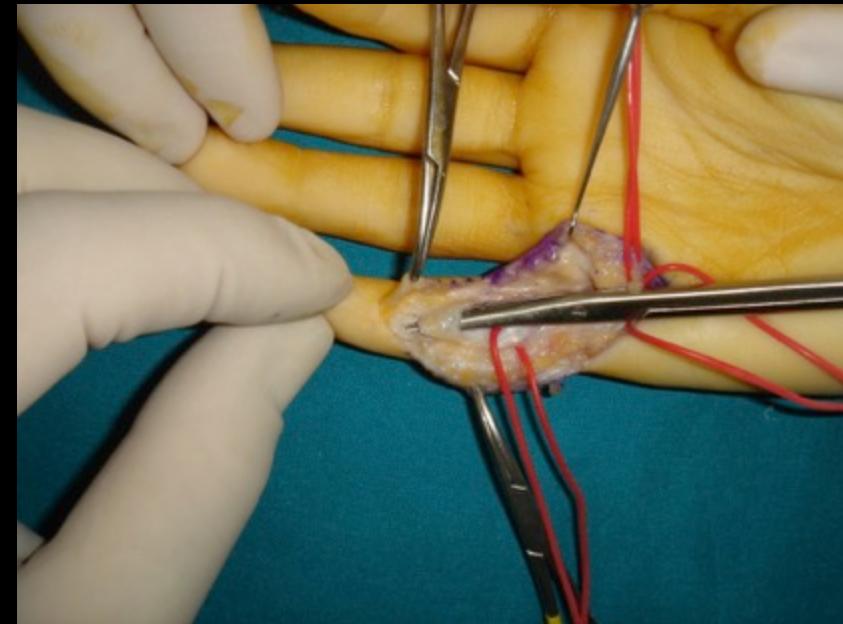

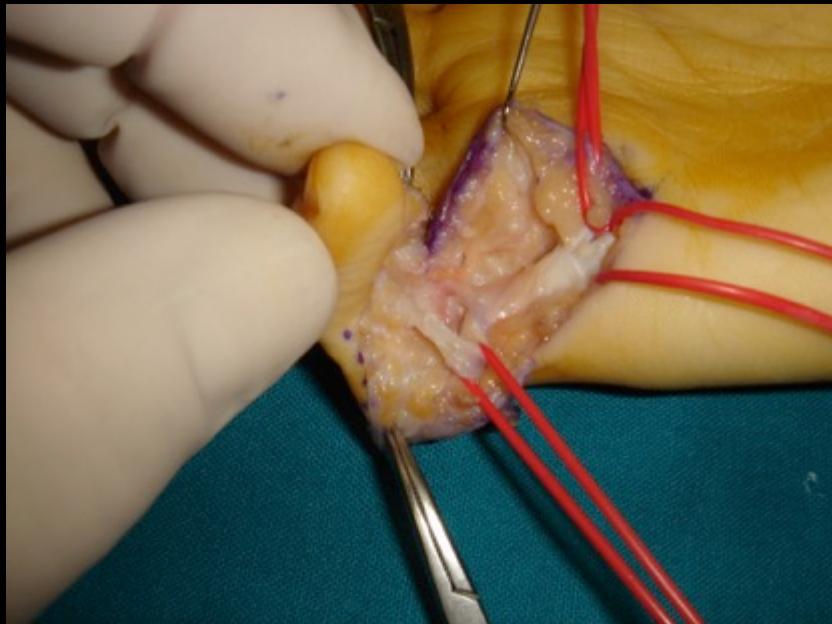

Dynamic splints in flexion and in extension, worn several hours per day (switching flexion and extension) and even during the night

Preliminary report

- Tenolysis and in general tendon surgery is followed by an inflammatory response which leads to: scar tissue formation-preventing regeneration of synovial sheaths and interfere with final tendon gliding
- Dynavisc – as shown in other studies in literature (M. Riccio, *Hand Surg*, 2015) – is demonstrating to reduce inflammatory response reducing pain (VAS<<) and improving range of motion (TAM >>) after tenolysis
