

Treating Hallux Rigidus with Hemi Implants

DETAILS THAT MATTER.

Reported clinical use since 1952¹ with over a dozen studies reporting on average 95%+ implant survivorship[†]. The BioPro First MPJ Hemi has clinical data on patients 20+ years post-op.¹

Maintains natural anatomy

Minimal resection maintains length and soft tissue attachments. Revision from phalangeal based hemi implants results in similar success to primary arthrodesis with no loss of length evident.²

Patient Preferred

Studies report higher satisfaction than fusion due to faster return to activity and additional footwear choices.² Recommended in young, low to moderate demand patients (age 50+ years) with grade II/III hallux rigidus.
